My background is in geodetic research, and I obtained a PhD in Geophysics (University of Alaska Fairbanks) studying deformation of Alaskan volcanoes using GPS and satellite radar interferometry. Since 2006, I have been with Unavco, a non-profit supporting geoscience research and education using geodesy, and have been involved in all aspects of the installation and operation of the Plate Boundary Observatory. Most recently, I have been coordinating efforts to integrate GPS systems into the USGS-operated Earthquake Early Warning System for California.
